

TruthLens

AI-Powered Digital Forensics Report

CASE INFORMATION

Case ID	TL-2026-812566
Analysis Start	31 August 2026 09:30:00 UTC
Analysis Completed	31 August 2026 09:30:05 UTC
Report Version	1.0
Report Generated	N/A

INCIDENT CONTEXT & COMPLAINT DOCKET

Incident Classification	Financial Fraud & KYC Spoofing
Platform / Circulated	instagram
Date & Time Encountered	31 August 2026
Suspect Identifier / Handle	8125661060

Incident Narrative & Circumstances:

A unknown person call to my number and asked money about 30000 ,if not given then he will upload images in social media

Extortion / Ransom Demands Record:

demand 30000 via scanner

1. EXECUTIVE ASSESSMENT

POTENTIAL DEEPPFAKE

Risk Level	HIGH
Confidence	HIGH

Explanation:

Synthetic visual features detected across face and background boundaries.

2. REFERENCE MEDIA

(Preview unavailable)

Filename	N/A
Content Type	N/A
File Size	N/A
Resolution	N/A
AI Result	N/A
AI Score	N/A
Confidence	N/A

SHA-256 Hash:

N/A

3. SUSPECTED MEDIA

(Preview unavailable)

Filename	N/A
Content Type	N/A
File Size	N/A
Resolution	N/A
AI Result	Likely AI-Generated
AI Score	96.2%
Confidence	N/A

SHA-256 Hash:
N/A

4. AI AUTHENTICITY ANALYSIS

Parameter	Reference Media	Suspected Media
Prediction	N/A	Likely AI-Generated
AI Detection Score	N/A	96.2%
Confidence	N/A	N/A
Generator Type	N/A (Real)	Diffusion (confidence: 84.5%)

Note: Raw model outputs and pixel forensic features are combined via evidence fusion to improve robustness.

5. FACE IDENTITY VERIFICATION

Reference Face Detected	No
Reference Faces Count	1
Suspected Face Detected	No
Suspected Faces Count	1
Cosine Similarity Score	N/A
Threshold Used	N/A
Verification Result	N/A

6. MODEL & PROCESSING INFORMATION

AI Detection Models	N/A
Ensemble Method	N/A
Authenticity Threshold	N/A
Face Detection Model	MTCNN (facenet-pytorch)
Face Embedding Model	InceptionResnetV1 — VGGFace2
Face Similarity Metric	Cosine Similarity
Face Threshold	N/A
Decision Engine	TruthLens Rule-Based Engine v1.0

7. EVIDENCE INTEGRITY

Reference Media SHA-256:
N/A

Suspected Media SHA-256:
N/A

The SHA-256 hashes above uniquely represent the analysed file contents at the time of processing. Re-computing the hash of the original file and comparing it to the value above can be used to confirm whether the file contents have been altered since analysis. Hashing provides integrity verification, not authenticity proof.

8. LIMITATIONS & DISCLAIMER

AI-Assisted Screening:
This report records the results of an AI-assisted forensic screening analysis. It does not independently establish the authenticity of the media or prove criminal activity.

Not Legal Evidence:

This assessment should not be treated as definitive proof of manipulation, identity, or criminal activity. Results are probabilistic and subject to error.

Potential False Positives:

The AI detection system may classify authentic media as AI-generated in some cases, particularly with heavily compressed, stylised, or edited content.

Potential False Negatives:

Novel deepfake techniques not represented in model training data may evade detection. A 'Likely Real' classification is not a guarantee of authenticity.

Face Verification Constraints:

Face verification may fail for occluded, low-resolution, or extreme-angle faces, resulting in an UNABLE_TO_VERIFY result.

Privacy:

Uploaded media and biometric analysis data should be handled according to applicable privacy and data-protection requirements.
